What is Net Metering?

Net metering is a billing mechanism that allows individuals and businesses who generate their own electricity using solar panels to feed the excess electricity back into the grid. When your solar system produces more electricity than you consume, the surplus is sent to the utility grid, and you receive credits in return.

These credits can be used to offset the electricity you draw from the grid when your solar system is not generating enough, such as during nighttime or cloudy days. This system helps reduce electricity bills and encourages the use of renewable energy sources.

Net metering makes solar energy more affordable and accessible, promoting energy independence and sustainability. In many countries, including Pakistan, net metering has become a key incentive for adopting solar technology.
